To Whom It May Concern:

We would like to inform our customers that insects such as termites, ants, spider mites and ticks do not come from Woodcarpet® due to the process in which it is manufactured. The Woodcarpet® production process will destroy any insect as it goes through the grinding process. We use high quality wood chips which are then fed into a grinder which spins at over 3000 RPM's. The chips are pulverized into many pieces killing any insects and destroying any eggs that are present. Woodcarpet® is 100% wood and all natural with no preservatives or chemicals added so insects such as termites could be attracted to the surface. However, it is difficult for termites to tunnel into Woodcarpet® because the pieces are too small and termites prefer large, solid pieces of wood to burrow into.

If insects are present after the Woodcarpet® has been installed, our suggestion is to check the surrounding area for possible infestation and call a pest management specialist who can deal with insect infestation or try a natural repellent such as a mixture of vinegar, mild detergent and water which can be applied with a common pump sprayer to the surface. Suggested mixing ratio – 50/50 water and vinegar plus a cup of detergent.

I hope this helps in answering your questions,

Jeff Mrakovich
